

VIZQ™

**More patients. Smarter workflows.
Measurable progress.**

The adaptive VR platform built by clinicians, for clinicians.

What VIZQ Is: Adaptive VR-based life skills instruction with an intelligent prompting layer that replicates the way a skilled therapist works, delivering measurable, data-driven results for neurodiverse learners.

Who It's For: OTs and SLPs working with autistic children and children with developmental disabilities who are ready to extend their clinical reach without adding to their administrative burden.

How It Works: Behavior modeling, guided practice, adaptive prompting, randomization, and automatic data capture – written in plain language without jargon.

What It Does For Your Practice:

- Your session plan is already built – walk in, launch VIZQ, and focus entirely on your patient.
- Extends therapist bandwidth without additional headcount
- Automatically generates session data for SOAP notes, compliance, and Medicare reporting – HIPAA compliant
- Supports measurable progress documentation that justifies continued care
